Persona name: John Music

Assigned segment: Preparation-first internalizer

Real interview quote: "I remember it, and then I practice it the right way until it becomes muscle memory." — Maddux Vitrano, University Ensemble Performer

Goals: Adequate pre-rehearsal prep time and dedicated practice intervals between run-throughs to absorb complex transitions, fingerings, or multiple director critiques.

Pains: High anxiety/performance lag when forced to perform new, complex passages or rapid multi-part director corrections before having enough time to absorb and lock them into muscle memory.

Behaviors: Relies heavily on pre-rehearsal prep, solo practice sessions, and mentally logging callouts and directions.

Scenario 1: Rapid-Fire Director Corrections Between Run-Throughs

trigger: During a live run-through, the director halts the ensemble at measure 42 after a messy transition and delivers three rapid-fire verbal corrections regarding dynamics, an accelerando, and altered accidentals.

Context: A 90-minute concert band rehearsal where the director expects immediate re-execution without taking a break to write out physical notes on the page.

Goal: Mentally absorb and process the verbal feedback, mentally executing the fingerings/breath control so the corrections lock into muscle memory before playing the passage again.

Current Pain: The director counts off the next take immediately without providing a brief 30-second processing window. Forced to play before converting verbal critiques into automatic physical responses, John experiences cognitive lag and misses an entry—not because he couldn't navigate the page, but because he lacked the time needed to internalize the guidance.

Scenario 2: The Unannounced Sight-Reading Run-Through

Trigger: At the start of rehearsal, the director hands out a new piece containing complex time signatures and rapid interval leaps, giving the ensemble only 60 seconds before calling for a full run-through.

Context: An ensemble rehearsal setting where new repertoire is introduced with no advance notice or individual prep time provided.

Goal: Scan the score to isolate difficult rhythmic sections, mentally map structural transitions, and work out tricky fingerings beforehand so his hands can respond automatically during the group execution.

Current Pain: Deprived of the 5 to 10 minutes of solo prep time he normally uses to absorb new material, John is forced to sight-read on the fly. Without time to store the guidance in memory prior to playing, he feels exposed and vulnerable to performance errors during the ensemble run-through.

User Story 1: As John Music, I want to isolate and loop difficult measures during individual pre-rehearsal prep, so that I can build reliable muscle memory and reduce my reliance on the score during live group rehearsal.

User Story 2: As John Music, I want to quickly capture and review audio or visual summaries of director callouts between rehearsal takes, so that I can mentally process multiple corrections without having to stop and write detailed annotations on my score.

User Story 3: As John Music, I want access to pre-formatted practice materials and audio cues prior to rehearsal, so that I can absorb tricky rhythms and key changes on my own time and avoid the risk of stumbling during unannounced ensemble run-throughs.

User Story 4: As John Music, I want a streamlined way to organize and preview new pieces ahead of time, so that I can mentally map out structural transitions and enter rehearsals confident that my performance is automatic.
